

Boneo Water Recycling Plant

Project update

Plant commissioning activities continue to progress well, with the plant on track to service the peak summer 2021/22 season.

During September, commissioning activities continued for the recycled water treatment facility and dewatering building. The team also started commissioning activities for the biosolids process.

Sitewide signage, line marking, and spoon drains completed

A milestone was reached in September when the treatment process started producing biogas. Once at the correct levels, the biogas will be used to generate electricity onsite to help power the treatment plant.

Site sheds and offices will be removed off-site and the area reinstated in by end of January 2022. We anticipate the major plant upgrade works to be completed by the end of 2021.

In 2022 works are planned to for the emergency storage lagoon which will involve some earthworks in south-west corner of the site. We'll keep you updated on these works.
